larg	in administrator noticed a consistent spike in processor and memory activity on the organisation's web servers that host a ge web application, this was after installing Secure Socket Layer/Transport Layer Security (SSL/TLS) for security. This reased activity degraded the web application's responsiveness. What is the best-practice solution to resolve the situation?
	Migrate the web application onto m4.4xlarge EC2 instances with robust compute, processing and networking capability.
	Offload the SSL/TLS from running locally to AWS CloudHSM.
×	Create an auto-scaling group that scales out as traffic to the web application cluster increases.
	Create a custom AWS CloudWatch metric to monitor the instance resources, by writing a script in the AWS Command Line
0.0	Interface (AWS CLI).
